

Create Azure Web App

To Begin with the Lab

Summary

This lab demonstrates how to create an Azure Web App using Azure App Service. You will create a resource group, configure an App Service plan, create the web app, verify that it is running by accessing its URL, and finally clean up the resources to avoid unnecessary charges.

Understanding

Azure App Service is a Platform as a Service (PaaS) offering that allows you to host web applications without managing servers, operating systems, or infrastructure. Microsoft Azure handles patching, scaling, load balancing, and maintenance automatically. During the creation process, you select a Resource Group to organize resources, an App Service Plan to define the compute resources, and a Runtime Stack based on your application's programming language. Once deployed, Azure provides a unique URL that can be used to access the application from anywhere on the internet.

Example:

Suppose you have developed a Python Flask website. Instead of creating and managing a virtual machine, you can deploy the application to Azure App Service. Azure automatically hosts the application, provides an HTTPS-enabled URL, and allows you to scale the application as traffic increases.

Lab step

Step 1: Sign in to Azure Portal

- Open the Azure Portal.
- Sign in using your Azure account.

Step 2: Open App Services

- In the search bar, search for **App Services**.
- Open the **App Services** service.
- Click **Create**.

- Select **Web App**.

Step 3: Configure Basics

- Choose your **Azure subscription**.
- Create or select a **Resource Group**.
- Enter a unique Web App name (**Web-dev-us-12**).
- Select **Publish: Code**.
- Choose the appropriate Runtime Stack (**.NET 10 (LTS)**)
- Select the Operating System (**Windows**).
- Choose the Region (**East US**).

Step 4: Create an App Service Plan

- Create a new App Service Plan or **select an existing one**.

Pricing plans

App Service plan pricing tier determines the location, features, cost and compute resources associated with your app.

Next steps

Manage deployments for your app. Recommended

Protect your app with authentication. Recommended

Go to resource

Step 7: Access the Web App

- On the Web App Overview page, locate the **Default Domain**.
- Click the provided URL.
- Verify that the default Azure App Service webpage opens successfully.

Your web app is running and waiting for your content

Your web app is live, but we don't have your content yet. If you've already deployed, it could take up to 5 minutes for your content to show up, so come back soon.

 Supporting Node.js, Java, .NET and more

Haven't deployed yet?
Use the deployment center to
publish code or set up continuous
deployment.

Step 8: Modify the Home Page

- Open Pages → **Index.cshtml**.
- Replace the existing content with a simple **Hello World** webpage.
- Save the file.

  <div class="box">
    <h1>Hello World</h1>
    <p>My Azure Web App Is Working Successfully.</p>
  </div>
</body>
</html>
```

Step 9: Build the Project

- Build the project.

- Verify that there are no compilation errors.

Step 10: Publish the Web App

- Go to the Azure App service in **extension**.
- Sign in to Azure if required.
- Select the previously created **Web App**.
- **Right-click** the Webapp.
- Select **Deploy**.
- Wait until **deployment completes** successfully.

Step 11: Verify Deployment

- Open the Azure Portal.
- On the Web App Overview page, locate the **Default Domain**.
- Click the provided URL.
- Verify that the default Azure App Service webpage opens successfully.

Result

The ASP.NET Core Razor Pages application was successfully published to Azure App Service. The application is accessible through the Azure Web App URL, confirming that the deployment was successful.
