

Lab - Azure Container Registry

To Begin with the Lab

Summary

This lab demonstrates how to create an Azure Container Registry (ACR) using the Azure Portal. Azure Container Registry is a managed service used to store and manage Docker container images, which can later be pulled by Azure services or other applications.

Understanding

Azure Container Registry (ACR) is a private Docker registry hosted in Azure. It allows you to securely store, manage, and distribute container images. Each registry receives a unique login server name (for example, myregistry.azurecr.io). After creating the registry, Docker images can be pushed from a local machine and pulled by Azure services such as Azure App Service, Azure Kubernetes Service (AKS), Azure Container Apps, and Azure Container Instances.

Example:

A developer builds a Docker image for a .NET web application on their laptop and pushes it to Azure Container Registry. Later, Azure App Service pulls the same image from ACR to deploy the application.

Lab Steps

Step 1: Open Azure Portal

- Sign in to the Azure Portal.
- Click **Create a resource**.
- Search for **Container Registry**.
- Select **Azure Container Registry**.
- Click **Create**.

Step 2: Configure the Registry

- Select the desired **Subscription**.

- Choose an existing **Resource Group**.
- Enter a **unique Registry Name**.
- Select the preferred **Region** (for example, East US).

Create container registry

Basics Networking Encryption Tags Review + create

Azure Container Registry allows you to build, store, and manage container images and artifacts in a private registry for all types of container deployments. Use Azure container registries with your existing container development and deployment pipelines. Use Azure Container Registry Tasks to build container images in Azure on-demand, or automate builds triggered by source code updates, updates to a container's base image, or timers. [Learn more](#)

Instance details

Registry name * regdeves12 ✓

Location * East US

Step 3: Configure Registry Options

- Keep the default **Domain Name Label Scope** if no special protection is required.
- Understand that changing the scope can help reserve the registry name if the registry is accidentally deleted.
- Select the **Basic** pricing tier for this lab.

Domain name label scope * ⓘ Unsecure

Registry domain name regdeves12.azurecr.io

Use availability zones ⓘ ☐
 ⓘ Availability zones are activated on premium registries and in regions that support availability zones. [Learn more](#)

Pricing plan * ⓘ Basic

Role assignment permissions mode ⓘ
☐ RBAC Registry + ABAC Repository Permissions

Step 4: Review and Create

- Click **Next** through the remaining tabs such as Encryption and Tags.
- Select **Review + Create**.

Step 5: Verify the Registry

- Wait until the deployment completes.
- Open the newly created **Azure Container Registry** resource.
- Confirm that the registry has been created successfully.
